learn. build. operate

WEEK 4 · DAY 3

Build a CrewAI Travel Planner Agent

Assignment | learn. build. operate

1. Problem Statement

Build your first **CrewAI** agent. The user types in a city, and a **Travel Planner** agent suggests **3 places to visit** there. Give the agent a clear **role**, **goal** and **backstory**, hand it one **Task**, assemble both into a **Crew**, then run it with `crew.kickoff()` and print the result.

Tools: Python, CrewAI, an OpenAI API key

2. Requirements

- Keep all your code in a single file named `travel_planner.py`.
- Ask the user for a city with `input()` when the script starts.
- Create **one Agent** with **role**, **goal** and **backstory** written as real sentences, plus `verbose=True`.
- Create **one Task** whose **description** asks for exactly **3 places** in that city, with an **expected_output** describing the shape you want back.
- Build a **Crew** from that agent and task, run it with `crew.kickoff()` and print the result.
- Read your API key from an environment variable, never hard-code it or commit it.

> **Think it through**
>
> The backstory is not decoration: it steers what the agent writes. Who is your planner writing for? And what must `expected_output` say to get three clean suggestions back instead of an essay?

3. Steps to complete

These are hints, not the full answer. Fill in the blanks yourself.

Step 1: Set up the project

CrewAI needs both an API key and the name of the model it should call.

```
mkdir travel-planner && cd travel-planner
python -m venv venv
# macOS / Linux                    # Windows (PowerShell)
source venv/bin/activate           venv\Scripts\Activate.ps1
pip install crewai                 pip install crewai
export OPENAI_API_KEY="your-key"   $env:OPENAI_API_KEY="your-key"
export MODEL="openai/gpt-4o-mini"  $env:MODEL="openai/gpt-4o-mini"
```

Any model your key can reach will work, swap the name if you use a different one.

Step 2: Write the agent, task and crew

This is the shape of the file. The `...` parts are yours to write.

```
from crewai import Agent, Task, Crew

city = input("Which city? ")

planner = Agent(role=..., goal=..., backstory=..., verbose=True)

task = Task(description="... {city} ...",
            expected_output="...", agent=planner)

crew = Crew(agents=[planner], tasks=[task])
print(crew.kickoff(inputs={"city": city}))
```

Whatever you put in `inputs` fills the matching `{city}` placeholder in the task description.

Step 3: Run it

```
python travel_planner.py
```

4. Final output

Try three different cities and check the suggestions really change. A run should end like this:

```
Which city? Jaipur
1. Amber Fort - hilltop fort with mirrored halls, go early
2. Hawa Mahal - the pink facade, best in morning light
3. City Palace - royal courtyards and a textile museum
```

5. What to submit

- Your `travel_planner.py` file, pushed to **GitHub**, with the link shared in **WhatsApp**.
- A screenshot of one full run, including the verbose agent output above the answer.
- Your screen-recorded video of the script running, posted in the **community**.
